
Information regarding optimization of the heating system

We will start an energy project together with Assemblin Energy Optimization where we will optimize and maintain our heating system to ensure comfort in a climate-smart and energy-efficient way. The work will take place both in the basement and in the apartments.

Background

This work is carried out for various reasons. There is a certain imbalance that creates uneven temperature in the property and that we also have components in the system that have reached their technical lifespan and must be replaced. This intervention should increase comfort while lowering energy costs and lowering our environmental impact.

This work will take place in the property week 18–26, there may be disruptions to the heat during the work. You will receive further information about a week before with the exact date of the visit and contact details for the contractor before all visits. All staff will carry identification (ID06).

Access

It is very important that Assemblin gets access on all occasions. Before each visit, you will receive written information about the exact dates we visit each apartment where the contact person at Assemblin is present. And information regarding the handling of keys for apartments and relevant basement storage.

Next winter season, a functional check of the work will be carried out as we will need access to your apartments again. More info on that will come as it gets closer.

Kind regards Riksbyggen, the board and
